

E-Commence ER Table

- A primary key (PK) uniquely identifies each row (aka record) in a table
- Each table has only one primary key
- A primary key can consist of a single column or multiple columns
- Values of primary keys, by default, cannot be null, and must be unique for each row
- The table with the primary key is called the parent table

- A foreign key (FK) forms a relationship between tables by referring to the primary key of another table
- It lets us cross-reference and understand connections between tables
- Each table can have more than one foreign key
- Values of foreign keys need not be unique
- A foreign key can be NULL
- The table with the foreign key is called the child table

Relationships

- The meaningful connections between tables (matched by primary and foreign keys) are known as relationships
- There are 3 relationship types based on how tables reference each other:

One-to-One

An employee can have only one laptop, and each laptop belongs to only one employee

One-to-Many (or Many-to-One)

A customer can place many orders, but each order belongs to only one customer

Many-to-Many

A student can work on many projects, and each project can involve many students

- Symbols are used to illustrate the relationship types between tables

Common symbols

- Zero or One an optional relationship
- One
- One and Only One
- Zero or Many an optional relationship
- One or Many
- Many
